

SPECK Cockroach Gel Bait

Imidacloprid 2.15%

(NEA No: SINNEAI-GeIRB/104/0731)

Cockroaches are one of the most serious food and residential pests worldwide and infest the places where food is stored, prepared, or served. The cockroach is resilient and difficult to control. They are carriers of the organisms causing diarrhoea, cholera, plague and viral diseases. In addition, they carry the eggs of parasitic worms and may cause allergic reactions including dermatitis, itching and more serious respiratory conditions. Many asthmatic patients are sensitized to cockroach allergens.

Speck cockroach gel baits can be selectively used in sensitive areas, such as premises used for the preparation of food, in hospitals and kindergartens.

Application of **Speck cockroach gel baits**

The application of **Speck cockroach gel bait** was not only found more convenient to both operators and clients but was also easy to apply (and was very stable under a wide range of conditions) and there was minimal disruption of the home or workplace.

Speck cockroach gel bait exerts no contact effects in gel form and does not vaporize into the surrounding atmosphere. This means there is no contamination of the environment by the active ingredient, and that the cockroaches must continue to have gel available to them until no more gel is being eaten.

Treatment with **Speck cockroach gel bait** was found to be highly effective and safe for the user and the local environment.

Pack size: 30gm/syringe
