

Lizard Glue Trap

PRODUCT DESCRIPTION:

Lizard traps are used as a mechanical device to trap nuisance lizards. They are placed in the pathways where lizards are suspected to travel. When a lizard walks on it, they get stuck and cannot escape. The lizards can then be removed with oil and released unharmed or destroyed as situations warrant. These traps utilize a roach pheromone or lure which works as an attractant since lizards will readily forage and feed on roaches. The scent, undetectable by people but easily sensed by lizards, will lure targeted lizards to the trap and once inside, they will get stuck. They also feature a self-mounting glue strip on their bottom making them mountable on walls and surfaces to better locate them where lizards like to forage.

WHERE TO USE THEM?

In the home or any building where lizard activity is noted. Simply set them out along the baseboard, countertop, shelf, floor, bookcase or any other area where you are seeing unwanted lizards. The glue and pheromone are completely harmless to people and pets so there is no hazard associated with their use in food areas, closets, bedrooms and living rooms.

EACH TRAP SHOULD HAVE 3 LURES PLACED IN IT TO INSURE MAXIMUM ATTRACTIVENESS.

Furthermore, it is highly recommended that traps be located and mounted on walls where lizards naturally forage. The self-attaching adhesive is found on the bottom of these traps make for easy mounting in key locations. Thumb tacks can also be used to help anchor traps should targeted lizards be strong enough to drag the traps away.
